INTRODUCTION

This Green Growth Urban Situation Review report aims to identify and evaluate the quality and availability of data (here in its broadest sense it includes all information) relevant to the city. green growth in Vietnam. This data is designed to have an overall picture of all "green growth" related activities:

- •being made; good
- •recently completed; or
- •is being considered for approval and will be implemented in the future.

In this respect, the report covers all activities related to "green growth" by: Government of Vietnam (including Ministries, agencies and provincial / city governments), research, multilateral and bilateral donors, non-governmental organizations, financial institutions, and the private sector.

Such a "assessment" is intended to help MOC and development partners identify:

- deficiencies in the policies of the state of green growth,
- the status and implementation of green growth in the urban context in Vietnam.

first REAL SITUATION OF URBAN GREEN GROWTH ON THE COUNTRY

1.1 POLICY FRAMEWORK

1.1.1 Purpose

Review, analyze and evaluate all national policies and activities related to urban green growth (UGG) under the Vietnam Green Growth Strategy (VGGS), the National Action Plan. on green growth (NGGAP) and the National Urban Development Plan (NUDP)

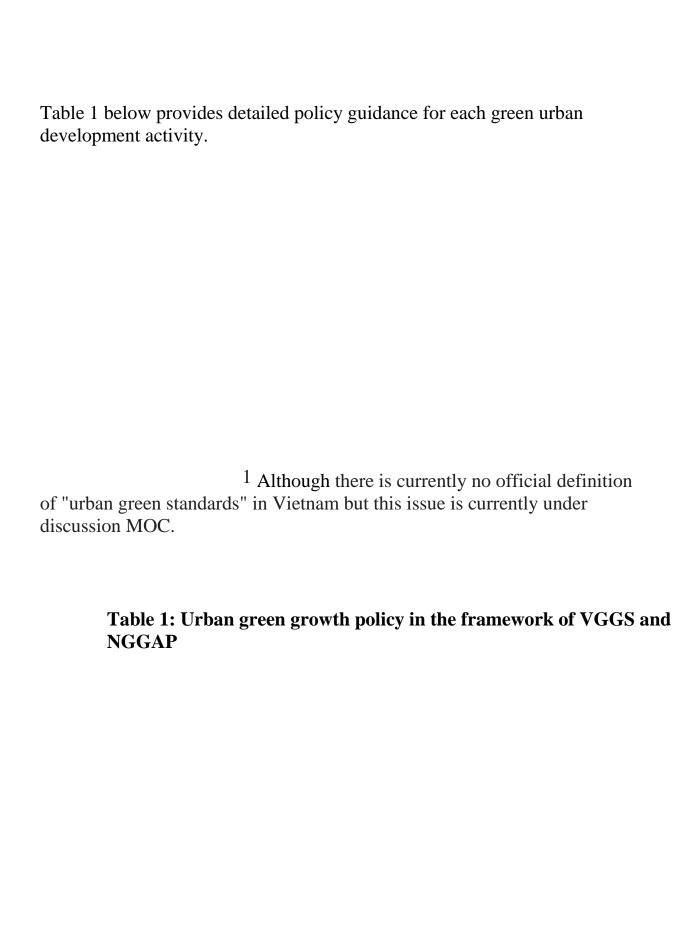

1.1.2 Vietnam's Green Growth Strategy (VGGS)

VGGS has been approved by the Prime Minister in Decision No. 1393 / QD-TTg dated September 25, 2012. This Decision covers several parts related to urban green growth. Specifically, the focus of VGGS's third strategic mission is green lifestyles and in particular promoting sustainable consumption among the Vietnamese people, which is considered the most directly related to urban growth management. green in Vietnam. The main targets for this task are:

- i) 60% of grade- III urban centers have wastewater collection and treatment systems up to prescribed standards;
- ii) 40% of grade- III urban centers have wastewater collection and treatment systems up to specified standards;
- iii) 100% environmental improvement in heavily polluted areas;
- iv) the rate of municipal solid waste collected and treated to meet the standards specified in the Prime Minister's Decision No. 2149/2009 / QD-TTg;
- v) 35-45% of public transport in large and medium urban areas, and
- vi) 50% of large and medium urban centers will reach the green urban standard 1.

In order to achieve the aforementioned "key mission" related to green growth cities, VGGS offers specific policy solutions, which are mentioned in VGGS's policy group 11 on "sustainable urbanization. firm ". This green growth urban policy group focuses on five urban development activities, which are:

- i) urban planning / master plan,
- ii) development of urban technical infrastructure,
- iii) development of green cities, eco-urban areas and green buildings,
- iv) urban transport, and
- v) green urban landscape

1. Urban planning / master plan :

- Review existing urban master plans based on a sustainable urban development approach, with a focus on the economical use of natural resources; revise these master plans and ensure that mid-tier cities achieve the green urban index by 2020.
- The master plan on urban space must satisfy ecological-economic efficiency; ensuring public transport, increasing the attractiveness of the city and competitiveness, friendly with the environment.

2. Development of urban technical infrastructure :

- Urban technical infrastructure (housing, transportation, energy, water supply, drainage, and waste treatment) should be accessible to everyone at an acceptable quality. be while reducing costs from pollution and traffic jams.
- To elaborate and implement a master plan on the rain water drainage system. Collection, transportation and treatment systems of municipal waste and wastewater.
- Applying green infrastructure and energy efficiency assessment systems to increase energy saving and reduce greenhouse gas emissions in cities.

3.,

Developing green urban areas, ecological urban areas and green buildings

•	Study	and issue	a star	ıdard sy	ystem	of urbar	n pla	anning	g and a	archi	tecture,

54 □□	☐ Review	and	adjust	urban	master	plans	and	develop	urban	renewal
	plans accor	rding	to sust	ainable	e standar	ds				

- Review and adjust the urban master plan according to the sustainable urban approach;
- Ensure that by 2020, urban centers will reach the average level and above the green urban index level
- Guide the development of pilot action plans for green urban development in several tourist cities (Hoi An, Sa P a, Hue, Vung Tau, Da Lat) and disseminate experiences.
- 55 \square \square Select and point out a number of seriously degraded old cities to improve housing quality and quality of energy supply, transportation, water supply and drainage and environmental landscape.
- 57 \square \square Apply policies to promote green technology in manufacturing construction materials and equipment.
- 58 □ □ Increase application of TCXDVN construction standards on "Buildings using economically and efficiently in energy" for 100% of newly built or renovated buildings according to this regulation.
 - Strengthen supervision and management for economical and efficient use of energy in buildings.
 - Promote the propaganda on the application of "green buildings" for economical and efficient use of energy in office buildings and enterprises.
- 56 Develop a standard system of urban planning and architecture, using environmentally friendly green materials and construction methods, saving energy, minimizing greenhouse gas emissions and developing appropriate technology solutions for municipal waste

Guidance on policies related to urban green growth in VGGS framework

• Issuing regulations aimed to force real estate developers to use state capital to adopt green building measures, new commercial buildings, and to renovate living quarters in metropolitan areas. market.

• Issuing regulations aimed to force real estate developers to use state capital to adopt green building measures, new commercial buildings, and to renovate living quarters in metropolitan areas. market.

4. Urban transportation

- To renovate and invest in the development of urban transport systems in centrally-run cities to reach the average level of the advanced regional countries
- Prioritize the development of public transport with participation of all branches, investment in vehicles using fuel efficiency;

5. Green urban landscape

- Allocate public land to increase greening area and water surface in urban areas so that the specified level is met.
- Mobilize capital to invest in green spaces in urban development projects.

Source: Adapted from VGGS and NGGAP, Ministry of Planning and Investment

59 Renovate and invest in the development of urban transport systems in centrally-run cities to achieve the average level of the advanced regional countries

- 60 Allocate public land to increase green cover and water surface in urban areas so that the specified level is met.
 - Including standards of civilized lifestyle, economical use of natural resources, environmentally friendly lifestyle

1.1.3 National Green Growth Action Plan (NGGAP)

The National Green Growth Action Plan was approved by the Government of Vietnam in accordance with Decision No. 403 dated 20/3/2014 of the Prime Minister which details activities related to urban green growth to be implemented in the period 2014-2020. Seven policy actions (from action 54-60) and 11 activities are already mentioned - as outlined in Table 1. It should be noted that the 5 policy guidelines on urban green growth in the VGGS have been presented. detailed into 7 actions and further detailed into 13 activities to be implemented in the period 2013-2020.

1.1.4 National Urban Development Plan (NUDP)

The National Urban Development Plan for the period 2012-2020 has been approved by the Prime Minister in Decision No. 1659 / QD-TTg dated November 7, 2012. According to this decision, by 2020, 45% of Vietnam's population will live in urban areas. By 2020, the urban system will include 2 special cities, 312 cities from grade I to grade IV and about 620 cities of grade V. To achieve the above target, this plan sets out a number of solutions. Policy will be implemented, covering policy aspects such as institutional, urban planning, awareness and human development, finance, science and technology. Of these, only a few policy measures are directly related to urban green growth, namely:

- a) Conducting research on green urban development to ensure rapid and sustainable urbanization; implementation of VGGS;
- b) Develop policies aimed at promoting new, advanced and environmentally friendly construction materials, using new technologies in the development of high-quality housing; impose discounted housing prices for different groups of low-income populations.
- c) Research on energy saving and energy saving measures / solutions in houses, offices and public houses.

1.1.5 Some comments on the Policy Framework

First, it is clear that while NUDP does not propose many policy measures on green growth urban areas, both VGGS and NGGAP detail relatively comprehensive policy measures on this subject. Other legal documents on urban

development such as the Law on Urban Planning No. 30/2009 / QH12 and Decision No. 445 / QD-TTg dated 7/4/2009 of the Prime Minister on "Approving the The master plan for Vietnam's urban system development up to 2025 and a vision to 2050 "only deals with aspects of urban development in general, not urban green growth in particular. The reason may be that the aforementioned law and decision were enacted before the VGGS was passed and "green growth" is still a very new topic and has not been discussed much in Vietnam.

Second, a series of measures are expected to be implemented in relation to green growth cities according to VGGS and NGGAP. However, it seems that the Ministry of Construction and other stakeholders will find it difficult to implement all the measures as outlined in the VGGS and NGGAP due to limited time, capacity and resources. According to the NGGAP, all urban green growth related activities are expected to be carried out in the period 2013-2020.

Third, it should be noted that in addition to activities directly related to urban green growth as outlined in Table 1, there are other activities indirectly related to this topic in VGGS and NGGAP. For example, activities related to building institutional capacity for green growth require all local government agencies (including municipalities) to develop a Action Plan for the increase of Local green growth (GGAP), or the topic of reducing greenhouse gas emissions and energy efficiency, or 'raising stakeholders' awareness of green growth, etc. These activities require Appropriate coordination among relevant ministries and branches of different types of cities in the process of implementing action plans related to green growth cities.

1.2 IDENTIFY ANY DEFECTS IN NATIONAL POLICY RELATED TO GREEN GROWTH

In fact, the policies designed for urban green growth in both VGGS and NGGAP are quite comprehensive. However, the main question to be addressed now is how these policies can be implemented in practice, due to the current institutional constraints of the government in general and the Ministry of Construction in particular.

Some difficulties can be listed here:

a) Institutionally, the green growth urban policies of VGGS and NGGAP are implemented because it was set out in a "Decision" by the Prime Minister, which has lower legal level than the Law and Decree. In addition, the Law on Urban Planning No. 30/2009 / QH12 and other policies / legal documents related to urban development such as Decree No. 37/2010 / ND-CP dated 7/4/2010 on "Establishment, Appraisal, Approval and Management of Urban Planning", Decision No. 1659 / QD-TTg dated

- November 7, 2012 on Urban Development Strategy in Vietnam, did not mention clearly and completely. issues related to policies and measures to implement urban green growth. Therefore, implementing all the green growth urban related policy measures as outlined in the VGGS and NGGAP will not be an easy task.
- b) Most urban green growth urban policy measures in the VGGS and NGGAP are formulated as state management functions of the Ministry of (provincial Construction and local authorities and municipalities). Therefore, it is important that the Ministry of Construction consider the implementation and integration of these policies into its current agendas on urban development planning and management, and local (municipal) government.) do the same in accordance with your state management duties. In fact, it would be a great initiative if the Ministry of Construction develops a new form of "Green Growth Urban Action Plan" to ensure the implementation of NGGAP on green growth cities in practice. However, the Ministry of Construction has yet to consider this issue. In addition, information on how to monitor and evaluate the progress of urban green growth in practice is not yet prepared and available.
- c) The concepts of urban green growth planning in general and urban green growth policy in particular are relatively new to Vietnam. Initially, some activities aimed at introducing this concept were carried out, but in reality local people, especially local cities often do not fully understand this concept. Therefore, it is likely that they will have difficulty implementing green growth urban activities in practice in the short to medium term.
- d) There are not many financial mechanisms in place for green growth funding. Plan National Action Growth green, financing for green growth operations will come from: i) Budget n Galaxy water, ii) Official Development Assistance (ODA); iii) Private sector; iv) Society. However, the current main source of funding for green growth activities is only from the state budget and ODA. More importantly, funding from banking (financial) institutions for green growth activities is very limited.
 - i) **State** budget: The **state** budget can be in the form of a national target program, public investment program / project, current costs to carry out green growth related activities, state funded.
 - ii) **Donors:** These are ODA projects, which can be grants or loans for green growth related activities.

1.3 IDENTIFY ANY ACHIEVEMENT AND SUCCESS RELATED TO GREEN / URBAN GREEN GROWTH BEFORE TO NOW

1.3.1 Achievements and successes related to green growth to date:

After the VGGS and NGGAP were approved by the government, some progress has been made at the national level such as the following:

- a) Inter-ministerial Coordination Committee for the implementation of the Vietnam Green Growth Strategy (VGGS) chaired by a Deputy Prime Minister to coordinate green growth activities established and by the Ministry of Planning and Investment. is the focal point. Members include representatives from ministries, associations, private sector etc. The Green Growth Coordinating Committee under the National Climate Change Committee, which is chaired by the Prime Minister. citizenship.
- b) Having received support from donors, the Ministry of Planning and Investment has conducted a number of research projects and drafted a number of guiding documents on green growth such as: i) green investment demand and cost-based methods curve expense margin decreased release of waste (MACC), ii) Report on the review of investment and public spending on climate change (CPEIR) (with the support of the World Bank and UNDP), iii) Guidance on Public Investment for Green Growth and Climate Change (with support from GGGI and UNDP); Guidance on Provincial Green Growth Action Plan (with support from KOIKA).
- c) The Ministry of Planning and Investment is the liaison with donors, international organizations and financial institutions to raise capital for green growth; The Ministry also established a working group on climate change finance (Decision 505 / QD-BKHDT dated April 25, 2013);
- d) The Ministry of Planning and Investment has drafted a guidance framework on prioritizing investment for climate change in the annual and 5-year socio-economic development plans;
- e) The State Bank of Vietnam (SBV) has issued an instruction on green credit:
- f) A number of provinces and line ministries are drafting or approving the Green Growth Action Plan. Five ministries: Transport, Ministry of Industry and Trade, Ministry of Construction, Ministry of Natural Resources and Environment and Ministry of Agriculture and Rural Development have drafted Green Growth Action Plan and two ministries have approved the are the Ministry of Agriculture and Rural Development and the Ministry of Natural Resources and Environment. Two provinces (Lao Cai, Hoa Binh) have approved the Provincial Green Growth Action Plan while 14 other provinces (Quang Nam, Da Nang, Lam Dong, Quang

Ninh, Ha Nam, Long An, Thanh Hoa, Ben Tre, Bac Ninh, Hue, Ninh Thuan, Lai Chau ...) are in the process of drafting and consulting on the Green Growth Action Plan with the support of international donors such as KOIKA (Korea), UNDP, ADB, USAID and BTC (Belgian Development Agency).

- g) The Ministry of Planning and Investment, the Ministry of Natural Resources and Environment and other ministries have organized many training courses and workshops in the provinces to raise awareness about green growth.
- h) The Ministry of Planning and Investment has established "Green Growth Fund" with funding from C Secondary Belgium.

Furthermore, the Ministry of Construction - the main government agency responsible for implementing various activities related to green growth cities as mentioned in the previous section, has also taken a number of actions such as:

- a) Reviewing and proposing amendments to the master plan for the development of the construction industry in accordance with the sustainable development approach as well as draft new regulations on urban green growth. For example, the Ministry of Construction issued new technical standards QCVN 09: 2013 on "Buildings using energy efficiency" on September 26, 2013 and the Prime Minister approved Decision No. 2623. / QD TTg dated December 31, 2013 approving the project on "urban development resilient to climate change".
- b) Develop a green growth policy framework and action plan for the construction industry in the period 2014-2020. The Ministry of Construction has piloted construction of green cities, green architecture, green master plan and ecological urban development; implementing a national program on urban upgrading resilient to climate change, etc.
- c) Cooperating with international organizations to study green growth cities, for example developing "criteria and procedures for certification of green buildings, green cities and green growth cities"; conducting research and development on green building materials.
- d) Organize many seminars to disseminate the results of studies related to Climate Change and Green Growth through the Vietnam Urban Forum.
- e) Cooperate with the Vietnam Urban Planning Institute and a number of other associations, organize awareness raising workshops on green growth cities, develop training materials on energy efficiency in buildings., energy audit, design and construction of green buildings, etc.

1.3.2 Some comments on progress in implementing green growth actions 7

- a) The implementation is quite slow. Most of the activities have only been carried out at the central level (ministries and centrally-run cities), while at the local level (city), the information remains unclear. In fact, many provinces have only limited information and awareness about both the VGGS and the NGGAP.
- b) Green Growth implementation is still at an early stage, local authorities pay little attention to this topic unless there is funding support;
- c) In general, resources are limited so that all levels of government can implement the green growth action plan program. Most of the activities have been carried out thanks to donor support.

2 REAL SITUATION OF URBAN GREEN GROWTH URBAN (THAI NGUYEN CITY, TRA VINH CITY, ELECTRIC BAN - QUANG NAM PROVINCE)

2.1 PURPOSE

This section t rong Report Assessment of the status overview of all the issues related to urban green growth in Taiyuan City, Tra Vinh city and town of Dien Ban (Quang Nam).

The main purpose is to develop a comprehensive green growth "profile" for each locality, thereby establishing a green growth baseline and their current information, and according to the capacity of each city. towns, guide them to progress on a journey towards a green growth future and also provide guidance on the additional competencies needed to achieve this goal.

2.2 LOCAL DATA SHEETS

Due to a number of plausible reasons, the consultant team was unable to reach the top management of the local government of the three projects, so the data collected was based on the available information.

The actual data collection for project localities (Thai Nguyen city, Tra Vinh city, Dien Ban - Quang Nam province) is shown in three local data tables on the following three pages.

In addition, the preparation and maintenance of local datasheets is considered a useful planning tool for localities involved in urban green growth planning, and therefore a mechanism Database has been created for this purpose and is detailed in section 4 of this Report. Forms for data tables attached report **is** in Annex **1.**

The following data tables are a static copy of the dynamic (searchable) that is included as part of the Green Growth Urban Database, as a separate result of this project and by the GGGI Office. Vietnam implementation.

2.3 SOME COMMENTS

Based on available data collected for the three provinces, there is a general perception that in all three project locations there is a lack of awareness of the concepts of green growth cities in the formal sense of targeting. Urban planning - a goal that not only brings about environmental sustainability, but also economic, social and institutional goals. The reason is that the concept of "green growth" is still relatively new in Vietnam, so this concept is not required to be reflected in the construction of Construction Master Plans of these localities - meanwhile, this master plan is the main tool for planning and management of urban space in the urban and urban communes . Condition "lack of awareness" exists in the majority of cities and urban communes across Vietnam, and was identified as a problem in other sections of this Report. Tra Vinh City can be an exception, this city has facilities to be proud of a clean green urban environment thanks to green spaces and green-shaded streets, so at least this city can claim a "green" profile, although it is not officially recognized in urban spatial planning mechanisms.

2.4 URBAN RECORDS GREEN GROWTH

It is clear that building a comprehensive green growth "profile" from data tables will be a very useful starting point on the journey to a local green growth future, as it encourages focus on specific issues related to each particular locality. In order to overcome the difficulties that may be encountered in collecting such data in this project, localities proposing to participate in the green growth journey should prepare their own green growth profiles. This will be a strong indication of their commitment to the future of green growth and will help establish baseline information to gauge their performance along the way. To achieve this goal, a "Guide to prepare dossiers urban green growth" has been prepared and is attached in the report **is** in **Appendix 2**.

3 NATIONAL AND INTERNATIONAL SUPPORTING GREEN GROWTH DEVELOPMENT IN VIETNAM

3 KEY RELATED PARTIES AT THE CENTRAL LEVEL

3.1.1 Purpose

Identify key green growth urban stakeholders in Vietnam: (including government agencies, research institutes, the private sector and international organizations, multilateral donors and Bilateral)

3.1.2 The main stakeholders of the government block grant central

The National Green Growth Action Plan (NGGAP) has identified key stakeholders responsible for ensuring the realization of urban green growth activities discussed in the previous section. These include: government agencies, research institutions, civil society (associations, households), and media, as follows:

- i) Central government agencies include:
 - Ministry of Planning and Investment,
 - Ministry of Construction,
 - Ministry of Finance,
 - Ministry of Transport,
 - Ministry of Science and Technology,
 - Ministry of Natural Resources and Environment,
 - Ministry of Education and Training,
- ii) Government agencies at the local level, including People's Committees of centrally-affiliated cities and provinces;
- iii) Civil society includes:
 - Vietnam Youth Union, Vietnam Women's Union, Vietnam General Confederation of Labor
 - Association of the Elderly, and other similar entities.
- iv) Media:
 - Radio Voice of Vietnam,
 - Vietnam Television Station,

The specific responsibilities of these key stakeholders in implementing VGGS and NGGAP activities are shown in Table 5.

Table 5: Urban green growth stakeholders in NGGAP

Source: NGGAP data

In addition to the key green growth urban stakeholders mentioned in the table above, the National Green Growth Urban Action Plan also identifies the financial resources for implementing urban-related activities to increase. Green growth comes from the state budget, private sector / business, international and bilateral donors, and households.

With regard to urban green growth, it is clear that the most important stakeholders will be the Ministry of Construction and the People's Committees at both provincial and city levels. Other stakeholders will act as the project partners and actors involved in the activity. It is important to note that the National Green Growth Urban Action Plan does not address the role of the scientific community in the implementation of green growth urban related activities, when in reality. They act as partners with MOC and other key stakeholders.

3.1.3 The main non-governmental stakeholders in green growth urban areas at the national level

There are many "stakeholders" involved in green growth activities and initiatives in Vietnam, including the following organizations. Their key interests and activities will be noted when possible:

- a) Multilateral donors
- b) Bilateral donors
- c) Program Human Settlements United Nations (UN-Habitat)
- d) Institute for Social and Environmental Transformation (ISET)
- e) The Rockefeller Foundation
- f) The Asia Foundation

Section 3.2.2 below provides details on the specific green growth urban projects associated with each NGO.

3.1.4 Key urban green growth stakeholders in the project's three pilot locations

The three pilot provinces of the project, Thai Nguyen, Tra Vinh and Dien Ban, are cities / towns under the administrative management of the provincial People's Committee. Consequently, these three localities have relatively limited authority in policy decisions and direction for local development. These local governments play a policy / planning role rather than a city development policy making role.

The stakeholders involved in the green growth cities of these three provinces are:

- a) Relevant line ministries as mentioned above as they are responsible for the coordination and formulation of urban green growth policy at the national level.
- b) The People's Councils of Thai Nguyen, Tra Vinh and Dien Ban provinces. In addition, provincial departments such as the Department of Construction, the Department of Planning and Investment, the Department of Finance, the Department of Transport, the Department of Natural Resources and Environment, etc., also play an important role in management. specific green growth urban activities in these locations.
- c) Municipal civil organizations (similar to those mentioned in the table above), business associations in all three localities.
- d) Research institutes and universities (at national and provincial levels);
- e) Local media.

3.2 INTERNATIONAL ASSISTANCE

3.2.1 Purpose

Comprehensive review of green growth urban activities has been carried out by bilateral and multilateral donors in partnership with the Government of Vietnam.

3.2.2 Database of sponsorship activities

To implement this "Green Growth Urban Situation Assessment", it is clear that an important requirement from the outset of the project is to identify and describe all current and existing "green growth" initiatives. finish; and as a result "Database of green growth funded projects" is attached to this Report in Appendix 4. The sponsorship activities database is a description of all related activities. to horizontal growth has been implemented (including proposals that have not yet begun to be implemented) in Vietnam during 2010-2015. In essence, this database is a 'gradually updated' document, and has yet to be analyzed to identify green growth policy patterns and gaps. Also at this stage, efforts to collect new data focuses mainly on project financing options, should consider expanding the database to integrate scientific research and initiatives in the private sector relevant personnel (if any). This "Funding Activities Database" is a key component of the green growth urban database in Vietnam as detailed in chapter 4 below.

3.2.3 Some comments and comments

- a) From the available information, it can be seen that the donor community supported green growth related activities in about 130 projects in the period 2010-2015 (as shown in Donor database in Appendix 2) with a total amount of nearly 7.5 billion USD. In which, nearly two thirds come from multinational organizations, led by the World Bank (accounting for 42.7% of total ODA or 67.1% of total ODA from multi-institutions. country) and ADB (20.1% and 31.6% respectively). During the same period, Japan was considered the leading bilateral donor in providing financial assistance for green growth urban activities, contributing 20.8% of total ODA or corresponding to 57.4% of the total amount of support from bilateral donors.
- b) Much of the work of green growth urban donors in Viet Nam focuses on urban infrastructure development, in particular transport, water supply, sanitation and energy. A substantial portion of the ODA is allocated to other urban activities and initiatives related to capacity building in urban development management, strengthening green city master plans, and development of technical standards. Green city techniques / standards etc. Structure of donor green growth urban activities during 2010-2015, both in

terms of total capital and number of projects, is shown in Figure 1 below.

Figure 1: Structure of donor support for urban green growth in 2010-2015

Source: Viet Nam Green Growth Urban Database (sponsored projects)

- c) Based on Figure 1, it is clear that, in the period 2010-2015, urban transport received a substantial amount of ODA, worth about 2.7 billion USD (or 36.1% of total capital). O DA). The World Bank, ADB, JICA and GIZ (Germany) are the main donors for urban transport development projects related to urban green growth.
- d) The urban water supply sector received more than 1 billion USD of funding (or 19.2% of the total amount) with the World Bank, JICA (Japan), Finland and KOIKA (Korea). Top sponsors.
- e) The sanitation sector received support capital of nearly 750 million USD (21.7% of the total amount) with the participation of major donors such as World Bank, JICA (Japan), GIZ (Germany.), DANIDA (Denmark).
- f) It is important to note that for the pilot cities, namely Thai Nguyen City, Dien Ban Town and Tra Vinh City, there are very few projects supported by development sponsors. For example, Thai Nguyen was recently involved in a KOIKA funded project on "urban green city planning in Vietnam" for the period 2015-2019. This project is implemented in two cities Thai Nguyen (Thai Nguyen province) and Rach Gia (Kien Giang province). The project

will use modern software to build a city master plan introduced by the Korean Urban Planning Institute.

4 VIETNAM GREEN GROWTH URBAN DATA BASES

This database is the collection of all references collected during the implementation of the Green Growth Status Assessment Report in Vietnam as well as in the development of Indicators and Directive Models. to urban green growth. In addition, this database also has references to reports and research papers etc. that may be relevant to the promotion of green growth urban initiatives in Vietnam, and especially including data on the three pilot cities: Thai Nguyen City, Tra Vinh City and Dien Ban Town (Quang Nam Province) are shown in Chapter 2, section 2.2 above and in Annex 2.

This green growth urban database in Vietnam is created on a computer and has the following structure:

This folder is divided into 4 Detailed Sub-Categories as follows:

4.1 SUBJECT : SPONSOR DATA BASES

Due to the wide variety of green growth-related projects / supports of many different donors, the consultant team found it necessary to develop a tool to easily search for these initiatives according to the most criteria. and allows for quick updating of the green growth support situation in different aspects, levels and locations classified by donors. This tool can sort donor activities according to keywords and many different criteria, from type of sponsor to name of sponsor, region and location. This tool is built in Excel so no installation is required. This tool works best with Office 2010.

More information about this donor database is given in Chapter 3, section 3.2.2 "Donor Activity Database" above. Static version of this tool is attached to the report **this** in Appendix **3.**

4.2 SUBSECTION: DATABASE DOCUMENT GUIDELINES OF LAW

Due to the increasing number of legal documents on green growth, the consultant team realized that it was necessary to build a tool to easily search for legal documents according to certain criteria, This enables quick updates on green growth in different aspects and levels of policy formulation. This tool can sort documents by keywords and many different criteria, from the field or area mentioned in the text to the focal agency. This tool is built in Excel so no installation is required. This tool works best with Office 2010.

In fact, this Sub-Category contains an excel file that is the foundation of the searchable database and a Sub-Section contains these legal documents. Static version: "The policy and national activities related to urban green growth," the report attached to **this** in Appendix **4.**

4.3 REFERENCES

This subsection contains published and accessible national and international papers and papers on the general theme of "green growth". These reports and studies were collected by GGGI and consultant team during the implementation of Phase 1 - Green Growth Urban Action Plan.

Vietnam. Static version: "References related to green growth," the report attached to **this** in Appendix **5.**

4.4 SUB-CATEGORY: GREEN GROWTH URBAN RECORDS DATA SHEET

This subsection contains three files, each of one municipality / town (Thai Nguyen city, Tra Vinh city, Dien Ban town) and can be expanded to include new cities in the future. Details about this Datasheet database are given in Chapter 2, section 2.2 "Local Data Tables" above, including the static version of each file. A copy of the form for other local application is shown in Appendix 1.

5 OVERVIEW OF THE CURRENT GREEN GROWTH ACTIVITIES OF VIETNAM

An important component in describing the current state of green growth in Vietnam is beyond factuality (e.g. the description of formal policies, programs, projects and initiatives). Other) as detailed in the previous Chapters of this Report, it is necessary to add informal statements about what is actually happening - to verify facts; It is a record of comments, statements and evidence of what is actually happening "on the ground" regarding the formation of green growth initiatives and activities at all levels of government of the government. Vietnam. This can be achieved by conducting additional interviews with key stakeholders (both governmental and non-governmental).

5.1 OVERVIEW OF CRITERIA INDICATOR FORMING OR UNDER CONSTRUCTION IN VIETNAM

Clearly there are many green growth urban related works in Vietnam, of which nine sets of indicators have been developed to support the urban planning and management process. As can be seen in the table below, only the first indicator "Monitoring and Evaluation of local sustainable development" is institutionalized by Decision No. 2157 / QD-TTg dated 11/11/2013 by the Prime Minister. Prime Minister; Other sets of indicators or indicators are not yet institutionalized, although some already exist and others are under construction. The application of all these indicators / indicators is still limited due to lack of capacity and resources and lack of monitoring and evaluation from different levels of government.

Table 6: Overview of the nine indicators that have been developed or are being developed in Vietnam

Numbe	Targets /	The focal point	Target	Legal status
r	indicators			
first	Local Sustainable Development Monitoring and Evaluation (LSI) index.	Ministry of Planning and Investment	To evaluate the sustainability of a locality in terms of three aspects: economic, social and environmental	Institutionalized by Decision No. 1257 / QD-TTg, applicable to provinces and centrally run city. The targets for lower tier cities have yet to be approved.
2	Urban Developmen t Index (UDI)	Ministry of Construction together with the United Nations Human Settlement Progra m and the General Statistics Office	To rate the level of urban development	In progress, expected to be completed in 2016
3	Urban Monitoring Index	Ministry of Construction with support from the United Nations	To assist in urban assessment, policy formulation and	Completed in 2013 with 97 monitoring indicators but

	(UOI)	Human Settlement Program	urban development plans.	not yet institutionalized
4	Urban Environment al Quality Index (UEQI)	Institute of Natural Resources, Environment and Biotechnology, Hue University	To assess and classify the environmental quality of a city.	Completed, no information regarding actual application.
5	Urban Environment al Quality Index (UEQI)	Institute of Environmental Management Science, Ministry of Natural Resources and Environment	To assess the environmental sustainability of a city	Proposed for special grade and grade 1 and 2.3 cities. Complete d in 2014, there is no information regarding actual adoption.
6	Urban Climate Change Resilience Indicators (URIs)	Ministry of Construction with support from ISET, TAF, Funded by the Rockefeller Foundation	To assess and rank an urban's resilience to climate change	The project is being piloted in Lao Cai, Uong Bi, Hoi An, Gia Nghia, and Ca Mau
7	The targets for Green -clean-beautiful city (GCBC)	Association of Cities of Vietnam and member cities.	To evaluate and rank cities based on green - clean - beautiful criteria t o create emulation movement	Launched in 2008, adjusted and added with green growth indicators in 2014. Approximately 20 cities are expected to receive certification by 2015
8	Worth-to-live	Conducted by	Ranking the level	Hanoi, Ho Chi

	cities (LCI)	international	of living worth of	Minh City and
	metrics	organizations	cities to evaluate	Da Nang
		(Mercer 2010	and compare the	participate in
		Quality of Life	development of	the ranking
		Survey), EIU etc.	cities around the	
			world.	
9	Asia Green	EIU, sponsored by	ranking cities by	Hanoi
	City Index	SIEMENS	environmental	participates in
	(AGCI)	Ongoing in 22	and climate	the rating
		Asian cities	intelligence,	
			thereby giving	
			urban authorities	
			a better	
			understanding of	
			their local	
			location than	
			other cities in	
			Asia	

Figure 2 below allows you to visualize that the differences and similarities between the seven indicators / indicators listed above are clearly related to green growth. The Green City Index (GCI), the Urban Living Index (LCI), the Urban Development Index (UDI) and the Local Sustainability Index (LSI) cover most of the four sub-groups of indicators including environmental, social, economic and institutional / governance aspects. Meanwhile, the Urban Environmental Quality Index only focuses on environmental issues. The urban environmental sustainability index focuses on both the environmental and governance aspects. Green-clean-beautiful targets focus mainly on environment / infrastructure and social sustainability.

Figure 2: Comparing 7 sets of indicators related to green growth

5.2 NATIONAL SURVEILLANCE ON URBAN GREEN GROWTH BY THE MINISTRY OF CONSTRUCTION

In April 2015, the Urban Development Department under the Ministry of Construction conducted a survey reviewing progress in implementing the National Green Growth Strategy in cities. This survey is titled "the implementation of Decision 1393 / QD-TTg on the Green Growth Strategy in Grade IV and above cities". Survey results are presented in Vietnamese only with the title "the implementation status of Decision 1393 / QD-TTg on the Green Growth Strategy in Grade IV and above cities".

The questionnaire is designed to consist of two parts: the first part contains 8 questions about basic urban information such as: - area, population, per capita income, gross domestic product, structure economy, built area, employment status, financial status. The second part contains 6 questions to review whether the city has a green growth-related action plan and / or activities, any donor

support for green growth. urban or not, and urban green growth choices, the need for urban support needs external support such as from governments and international donors to continue to work towards growth. green growth.

The questionnaires were distributed to most of the cities with grade IV and above (about 155 towns) but only 63 responded. Dien Ban Town and Tra Vinh City are two of the localities that have responded while Thai Nguyen has not yet returned the questionnaire.

Out of 63 cities that responded - 8 cities (Tra Vinh, Thai Binh, My Tho, Buon Ho, Gia Nghia, Tan An, Can Tho, Lang Son, Hai Phong) have green growth action plans. In addition, some cities have been participating in various programs related to green growth such as:

- Energy saving: Phuoc An, Buon Tram, Hoang Mai, Kon Tum, Lien Nghia, Hai Phong
- Reduction of greenhouse gas emissions: Hoang Mai, Ho Chi Minh City
- Climate change: Ben Tre, Di An, My Tho Hoang Mai, Quang Tri, Vinh Yen, Hai Phong, Chu Se, Ho Chi Minh City
- **Green-clean-beautiful:** Song Cong, Dong Xoai, Hong Ngu, Phu Yen, Ben Tre, Di An, Phuoc An, Vinh, Kon Tum, Vinh Yen, Lien Nghia, Hai Phong, An Khe, Ho Chi Minh City
- Resource **efficiency**: Dong Xoai, Phuoc An, Hoang Mai, Kon Tum, Chu Se, Ho Chi Minh City
- Cleaner production: Buon Tram Hoang Mai, Phan Rang, Ho Chi Minh City

With regard to their green growth options, most of the cities (80-90%) consider the following measures appropriate to their local conditions: 1) production and pepper sustainable use; 3) greener businesses through green technology development, resource saving, cleaner production, 4) sustainable infrastructure and 5) protection, exploitation and efficient use of resources.

In general, municipalities seem cautious about measures such as: 2) reducing greenhouse gas emissions; 6) restructuring the economy and adopting economic tools and 7) formulating and implementing ecological / green indicators.

Furthermore, very few cities have proposed actions to raise awareness of green growth in their communities.

In order to implement the green growth strategy, the proposed cities need the following support from the state and international donors:

- Provide technical assistance to develop green growth action plans
- Tools to manage green growth projects
- Support field visits at similar projects to learn from experience
- Training and capacity building
- Implementation of priority and / or pilot projects

6 ORIENTATION IN THE FUTURE

POLICY RECOMMENDATIONS

As detailed in this Report, the policy framework underpinning green growth policy interventions has been established in Vietnam through the Vietnam Green Growth Strategy (VGGS) and more recently, National Green Growth Action Plan (NGGAP). This policy framework focused on the actions of the ministries concerned and the cities t vibration level, this suite of centralized management model in Vietnam.

In a broad sense, this policy rationale is quite comprehensive to achieve the aim of providing an administrative framework in which green growth actions and initiatives can be identified, formulated and planned. implementation plan - though largely paused at the national level. Consistent with that, during the implementation of this project, the consultant team did not identify any clear gaps in this policy base to promote green growth. In this regard, as outlined in Chapters 1 and 2 above, "The Law on Urban Planning" and other policies / legal documents related to urban development such as the Decree "Making urban planning formulation and approval "related to urban development strategy in Vietnam," does not clearly and comprehensively address issues related to policies and measures to realize urban green growth. Therefore, implementing all the green growth urban related policy measures as outlined in the VGGS and NGGAP will not be an easy task.

However, as highlighted in this report and in its related report "Urban Green Growth Index", finally, the main area in which the integration of green growth initiatives and activities is required at the local level (urban, town). Therefore, a guide <u>key policies</u> to encourage the transfer of the action and green growth initiatives (within the framework prescribed at the national level) to municipalities and towns will be very helpful for activities this essential integration.

CONCLUDE

As stated in the introduction to this Report, "The Urban Green Growth Urban Assessment Report aims to identify and evaluate the quality and availability of data (here in its broadest sense is including all information) relevant to urban green growth in Vietnam".

This "status quo" assessment shows that the green growth urban policy frameworks are completely in line with state management objectives as a result of the adoption of the Vietnam Green Growth Strategy (VGGS) and National Green Growth Action Plan (NGGAP). However, the main issue that needs to be addressed is how these policies are implemented in practice considering the current institutional arrangements of the government in general and of the Ministry of Construction in particular, and due to the limitations. in terms of time, capacity, and resources available. The challenges associated with applying these policies in practice are detailed in Chapter 1.2 of this Report. In addition, comments on the current progress in implementing green growth actions show that activities related to "green growth" most are being carried out at the central level (Ministries and cities directly under the Central Government. While the information is not well understood at the local (city) level, many provinces have only limited information and limited awareness on both the VGGS and the NGGAP.

Role little emphasis of "the sub acute (city)" is shown in the group of advisers generally unsuccessful when reviewing "the status of urban green growth at the metropolitan level" in Project locations: Thai Nguyen City, Tra Vinh City and Dien Ban Town (Quang Nam Province), which resulted in the consultant team having only access to public property data. Therefore, the consultant team concluded that when a locality decides to pursue a green growth agenda, there is a need for a concurrent commitment of the People's Committee to collect the necessary data for the preparation of the green growth urban profile of the locality. Supporting localities to prepare urban green growth profiles from central agencies such as the Ministry of Construction, for example through the provision of Supporting Guidelines and Forms, will be of great help to localities. implementing green growth strategies and policies in practice.

In line with the conclusions outlined in the related report "Urban Green Growth Indicators", the consultant team is increasingly seeing that ultimate success in achieving a green growth future towards Vietnam's cities and towns will be entirely dependent on the actions taken by local (city) authorities.

Therefore, our main conclusion is that Vietnam now needs to pay more attention to integrating green growth concepts into subnational municipal government levels to complement activities that are currently underway. done at the national level.

APPENDIX 1: LOCAL DATA SHEET FORM

APPENDIX 2: GUIDELINES FOR DEVELOPING GREEN GROWTH RECORDS

BACKGROUND

The Vietnamese Green Growth Urban Model is proposed by GGGI to provide a roadmap to help a locality (province / town / town) identify, adopt and implement necessary activities and actions. to achieve "green growth" status as required by the Vietnam Green Growth Strategy and the National Green Growth Action Plan, and in line with the mandate of the Ministry of Construction.

This model is based on the notion that when a locality develops / expands in accordance with the standards in the Vietnamese urban classification system, that locality will step by step move up to the next highest level in the system. urban classification. In order to integrate green growth initiatives into all aspects of urban governance and spatial planning in Vietnam, green growth compliance standards need to become stricter as a city / town. improvement to a higher ladder in Vietnam's urban classification system.

In order to facilitate the adoption of the Green Development Urban Vietnam Model by localities at all levels of the urban classification system, one starting point should be identified with regard to all localities. , irrespective of their hierarchy in the urban classification system; That starting point is the proposed "Vietnam Urban Green Growth Profile".

DESCRIBE

A locality's green growth urban profile constructed to establish a baseline or starting point for this locality on a journey towards achieving a green future of growth proportional to its location In the Urban Classification, this is a statement of a green growth profile at any given moment.

The profile builds on a SWOT (Strengths, Weaknesses, Opportunities and Threats) analysis of all green growth activities and actions and will include the following components:

- 1. Identify and evaluate existing green growth urban related activities relevant to the locality;
- 2. Analysis of current and future urban development plans, including a description of the green growth components, if any;
- 3. Identify the environmental challenges facing the city;

- 4. Identify past achievements and successes in green growth;
- 5. Identify relevant locally relevant green growth stakeholders: including government institutions, research institutes, the private sector and international organizations, and multilateral donors and bilateral etc...
- 6. Review all green growth urban activities conducted by bilateral and multilateral donors that may be locally relevant (including elsewhere in Vietnam).

Documentation should also include consideration of the criteria and indicators identified in the proposed Vietnam Green Growth Urbanization Index. Doing this will serve as an introduction to this indicator and will make t iêu this category, as well as their role to measure progress in achieving the status of "green growth" and the need must become familiar with monitoring and evaluation.

The purpose of the "Profile of urban green growth" does not <u>have</u> to demonstrate the status of the local as a "green city" at any given time, but in order to identify all the issues that need to be decide to:

- a. Making progress on the green growth pathway;
- b. Improvement of ranking ranks in the Urban Classification System;
- c. Prepare the Green Growth Action Plan
- d. Transform green growth criteria into preparation of all relevant local master plans.

A "Green Growth Urban Profile" prepared by a locality establishes a green growth profile for this locality and thus its commitment to the Vietnam Green Growth Model. GGGI suggested.

DEPLOYMENT

Integrating green growth criteria into all urban spatial planning and management activities under the mandate of MOC will be a difficult process given the limited available resources (both financial and technical) and the administrative structure is too concentrated. However, recognizing that all urban governments in Vietnam have a legal obligation to promote green growth (that is, all forms of 'environmentally sustainable economic growth) by the Prime Minister. The Government has approved the VGGS, a clear roadmap that still needs to be defined and gradually transformed into green growth initiatives in all aspects of urban spatial planning and management.

For that outcome, the following actions are suggested for adoption and implementation:

- 1. At the request of the Ministry of Construction, the Terms of Reference for the formulation of all Urban Master Plans (scale of 1: 10,000) and Zone Plan (scale of 1: 2,000) must have one "A green growth urban profile "is prepared (or integrated if it is already prepared), which will serve as a reference point for green growth issues to be addressed in construction and update master plans.
- 2. The preparation of a local green growth action plan is likely to make little sense if the locality does not develop a Green Growth Profile in advance, the document that will provide the framework. and justification for proposed green growth actions and activities thereafter. Therefore, the development (or updating) of a Green Growth Profile must be a mandatory prerequisite for the Green Growth Action Plan development.
- 3. Before any donor participates in assisting any locality as proposed by the Ministry of Construction in developing the green growth roadmap, localities must first establish capacity profiles on their green growth by building a Green Growth Urban Profile.
